

Fund the goods already on their way.

A marketplace where anyone, from a bank account or a wallet, can finance real trade, and exporters get paid the day their goods ship.

The screenshot displays the TradeFlow 'Portfolio' page for user Ana Ruiz. The page is divided into several sections:

- Summary:** Shows 'Invested' (\$3,356.87), 'Expected returns' (\$49.66), and 'Received' (\$0.00).
- Positions:** A table listing active loans. One loan is shown: 'Invoice advance: 250 bags of green coffee, Huila washed' with a principal of \$3,356.87 and a status of 'Funded'.
- Deposits:** A table showing deposits made to fund loans. One deposit is shown: 'TF-MUXZSJTB' for the loan 'INV-2026-0142' with a status of 'Credited'.
- Identity:** A section showing identity verification status as 'Verified' and 'Approved'.

Shipped today, paid months later.

\$2.5 trillion

Global trade finance gap in 2022. Small exporters are the ones left waiting: their invoices are too small and too far away for banks to finance.

Source: Asian Development Bank, 2023 Trade Finance Gaps, Growth, and Jobs Survey.

Sell the wait to investors.

Exporters

Cash when the goods ship, not months later. No credit line needed.

Investors

Short, document-backed returns. The demo loans priced at 9% and 19% APR.

Buyers

Nothing changes for them: same invoice, same payment terms.

One product, two sides.

Investors see their positions, expected returns and what they have been paid, and pick new loans from the marketplace.

Trust without trusting us.

- **The buyer confirms every document** before it can be financed, and no document can be financed twice.
- **Credit is reviewed privately:** a business's financial data is never shown to investors or operators.
- **Repayment is confirmed by two independent sources** before investors are paid.
- **Reserves are checked continuously.** If the books disagree, new funding stops automatically.
- **Late loans are flagged** and the business cannot borrow again until it pays.

The bank booked money that never arrived, so funding paused on its own.

Why it has to be onchain.

Capital from anywhere

A bank transfer in Madrid and USDC from a wallet in Singapore fund the same loan and hold the same note.

Compliant by design

Each loan is a permissioned security token (ERC-3643). Only verified investors can hold or trade it.

Every decision on record

Listings, payouts, repayments and reserve checks are written onchain, so anyone can audit the book.

Rules that run themselves

Repayments settle automatically, late loans lock, and funding pauses when reserves do not match.

See it work.

A business requests financing, its buyer confirms, two investors fund it, the business is paid, the buyer pays, and both investors are repaid.

Built in 36 hours, running end to end.

- The full lifecycle runs on **Ethereum Sepolia**: listing, funding by bank and by wallet, payout, repayment, late loans. Every step is a real transaction.
- **20 contract tests** and an **end-to-end test of 15 checks** covering both portals.
- **Under the hood:** Chainlink CRE automates every off-chain decision, including a confidential credit review; loans are ERC-3643 tokens; prices come from Chainlink data feeds.

github.com/Maadhav/tradeflow

An open network for trade credit.

- **Any exporter, any investor, any corridor:** start with invoices, bills of lading and equipment orders between emerging markets and Europe, the US and the Gulf.
- **A secondary market** where verified investors trade loan notes before maturity.
- **Banks and fintechs as distribution:** they bring exporters and savers, we bring the rails.
- **Revenue:** a fee on every advance.
