Approved INV-2026-0142; grade A, 9%
APR, \$9,382 advance at EUR/USD 1.1270

0x22db...9d30

Shipped today, paid months later.

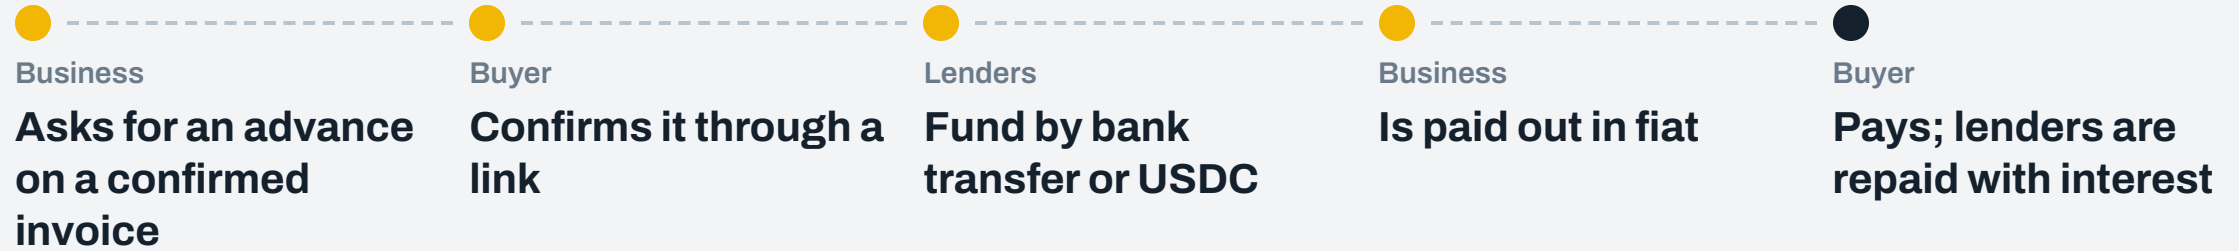

\$2.5 trillion

Global trade finance gap in 2022. Small exporters are the ones left waiting.

Source: Asian Development Bank, 2023 Trade Finance Gaps, Growth, and Jobs Survey.

Sell the wait to lenders.

Exporters

Paid when the goods ship, not months later.

Lenders

Short, document-backed yield. The demo loans priced at 9% and 19% APR.

Tradeflow

A fee on each advance.

Chainlink CRE makes every off-chain decision.

Listing

HTTP trigger, confidential TEE handler, EUR/USD Data Feed

Is the document real, confirmed and creditworthy? Then list the loan and issue its token.

Lender

Confidential HTTP, Vault DON secret, Data Feed check

Is the lender verified? Did the bank deposit really arrive at a fair rate?

Settlement

EVM log triggers, two-source consensus

Pay the business once funded. Mark it repaid only when the bank and the processor agree.

Monitor

Cron trigger, three-way reconciliation

Late loan? Freeze the business and pause its token. Books out of balance? Pause all funding.

Four workflows, seven handlers. Each decision lands onchain as a signed report through the CRE forwarder.

Confidential by design.

Stays in the enclave (`handlerInTee` , AWS Nitro)

- Revenue, open debts, payment history
- Document registry and sanctions results
- The API secret

Only the verdict leaves

- **Grade, APR, advance and a document hash**

```
Terminal: run 1, listing / verify-and-list

2026-10-06T22:50:56Z [SIMULATION] Running trigger trigger=http-trigger#1.0.0-alpha

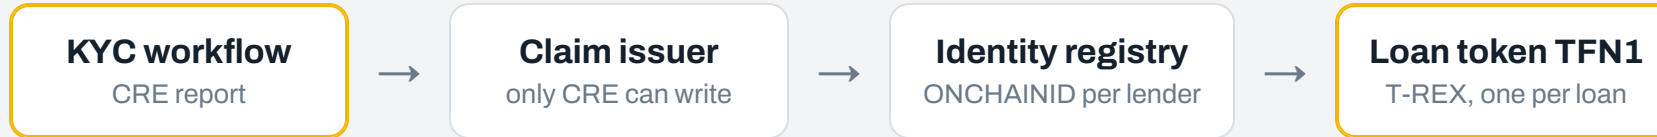

Trigger requested TEE Execution your trigger will run in one of the following Tees:
- AWS Nitro in us-west-2
The simulator is not a real TEE, and is meant to debug.
Do not use it for sensitive information.
During real execution, user logs for this trigger will not be visible, and will not leave the TEE.
They are presented in the simulator for debugging only.

Simulation complete! Ready to deploy your workflow?
Run cre account access to request deployment access.
```

The same run in the CRE CLI: the handler requests AWS Nitro, the simulator runs it locally and says so, then the signed report lands on Ethereum Sepolia.

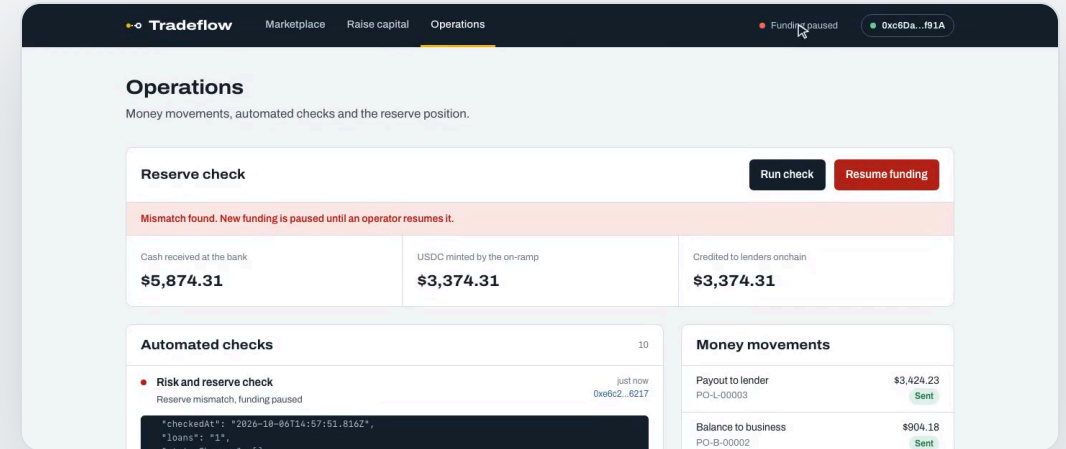

Every loan is an ERC-3643 token.

- **One T-REX token per loan**, deployed by the market when the listing report lands.
- **CRE is the trusted claim issuer:** a lender is verified only when the KYC workflow's report writes the claim.
- **Only verified wallets can hold or receive notes**, whether they lent by bank transfer or in USDC.
- **A late loan's token is paused onchain** until it is repaid.

Lenders do not take our word for it.

- **Every decision is a signed report** written onchain, with the evidence that produced it.
- **Repayment needs two independent sources** to agree: the collection bank and the payment processor.
- **Reserves are reconciled** across bank books, on-ramp mints and onchain credits. A mismatch pauses funding onchain.
- **Double financing is blocked:** a document's hash can be listed only once.

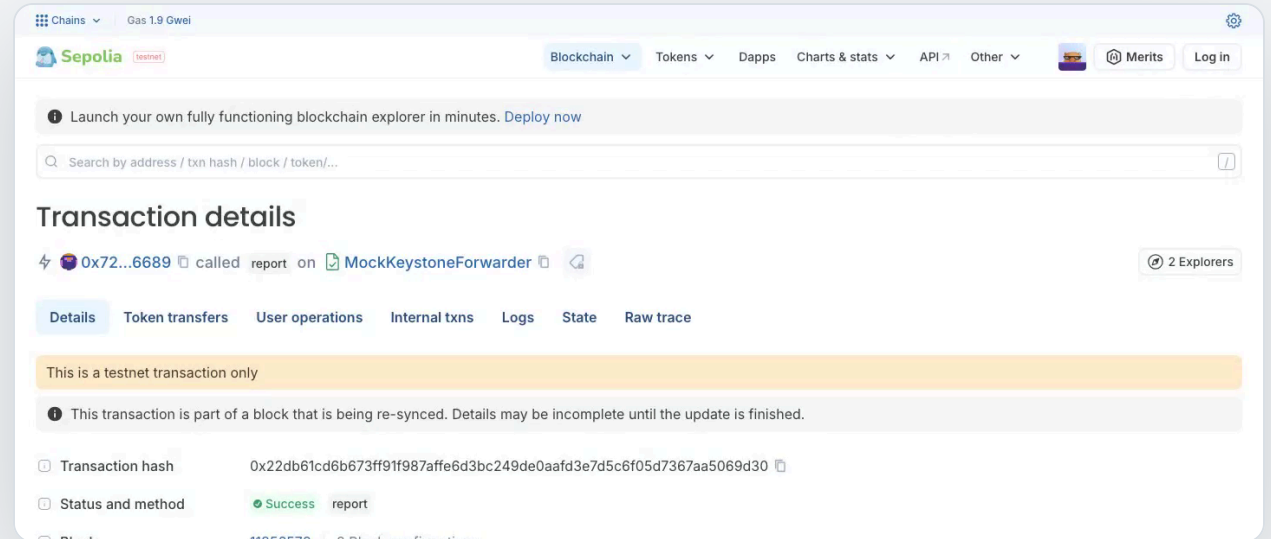

The bank booked a deposit that never reached the chain: the monitor paused new funding onchain.

It runs on Ethereum Sepolia.

- Every step of the loan lifecycle is a `create workflow simulate --broadcast` run that writes a real Sepolia transaction.
- 20 contract tests, and an end-to-end test of the full lifecycle with 14 checks.
- Every run's terminal output and transaction in the repo's evidence folder.

github.com/Maadhav/tradeflow

What is next.

- **Deploy on the CRE network** with confidential compute.
- **Real bank, KYC and on-ramp partners** behind the same workflows.
- **More documents and trade corridors.**
- **Secondary trading of loan tokens** between verified holders.
